Space Weather Highlights 24 – 30 March 2008

SEC PRF 1700 01 April 2008

Solar activity was very low for most of the week with the exception of 25 March which saw a period of moderate levels due to an M1/1f flare from Region 989 (S12, L=206, class/area, Cso/80 on 29 March) at 1856 UTC. The event was accompanied by a type II radio sweep and a coronal mass ejection from the east limb. The remainder of the week's activity consisted of occasional B-class flares from Region 987 (S07, L=260, class/area, Dai/170 on 27 March) and Region 988 (S09, L=234, class/area, Dso/300 on 26 March).

No proton events were observed at geosynchronous orbit.

The greater than 2 MeV electron flux at geosynchronous orbit reached high levels on 25, 27-29 March and reached very high levels on 30 March.

The geomagnetic field was initially quiet on 24-25 March and early on 26 March. However, beginning around 0400 UTC on the 26th solar wind measurements at ACE indicated the onset of a co-rotating interaction region which was subsequently followed by a high speed stream from about 26/1330 UTC and lasting through the remainder of the week. Geomagnetic activity peaked between 26/0600 UTC through 28/1500 UTC with mostly unsettled to active levels at mid-latitudes and mostly minor to major storm levels at high latitudes. The interplanetary magnetic field at ACE was enhanced between about 26/0400 UTC through about 27/0000 UTC with peak Bz values around -7 nT. Peak solar wind velocities were observed on the 28th with maximum values around 680 km/s. Geomagnetic activity declined to mostly quiet to unsettled levels from 28/1500 UTC through the end of the period.

Space Weather Outlook 02 – 28 April 2008

Solar activity is expected to be very low for most of the forecast interval. There is a chance for an increase in activity levels with the return of Region 987 (S06, L=262) on 19 April, and Region 988 (S06, L=237) on 21 April, although it is more likely that these regions will decay on the backside before they return.

No proton events are expected at geosynchronous orbit.

The greater than 2 MeV electron flux at geosynchronous orbit is expected to reach high levels for 06-12 April and for 23-27 April in response to expected recurrent geomagnetic activity.

The geomagnetic field is expected to be quiet for 01-04 April. Activity is expected to increase to unsettled to active levels with a chance for some isolated storm periods for 05-09 April due to a coronal hole high speed stream. Quiet to unsettled levels are expected from 10-21 April, followed by an increase to unsettled to active levels with isolated storm periods for 22-25 April with the arrival of another recurrent high speed stream. Activity should decline to quiet to unsettled levels for the remainder of the period.

NOTE: All smoothed values after September 2002 and monthly values after March 2003 are preliminary estimates. The lowest smoothed sunspot index number for Cycle 22, RI = 8.0, occurred in May 1996. The highest smoothed sunspot number for Cycle 23, RI= 120.8, occurred April 2000. *After June 1991, the 10.7 cm radio flux data source is Penticton, B.C. Canada. Prior to that, it was Ottawa.

Weekly Geosynchronous Satellite Environment Summary Week Beginning 23 March 2008

Protons plot contains the five-minute averaged integral proton flux (protons/cm²-sec -sr) as measured by GOES-11 (W135) for each of three energy thresholds: greater than 10, 50, and 100 MeV.

Electrons plot contains the five-minute averaged integral electron flux (electrons/cm²-sec -sr) with energies greater than 2 MeV at GOES-12 (W075).

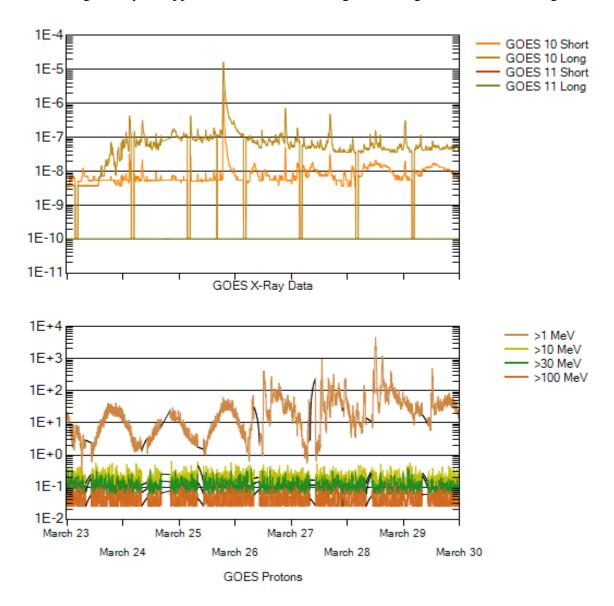

Hp plot contains the five minute averaged magnetic field H - component in nanoteslas (nT) as measured by GOES-12. The H component is parallel to the spin axis of the satellite, which is nearly parallel to the Earth's rotation axis.

Kp plot contains the estimated planetary 3-hour K-index (derived by the Air Force Weather Agency) in real time from magnetometers at Meanook, Canada; Sitka, AK; Glenlea, Canada; St. Johns, Canada; Ottawa, Canada; Newport, WA; Fredericksburg, VA; Boulder, CO; Fresno, CA and Hartland, UK. These data are made available through cooperation from the Geological Survey of Canada (GSC), British Geological Survey (BGS) and the US Geological Survey. These may differ from the final Kp values derived from a more extensive network of magnetometers.

The data included here are those now available in real time at the SEC and are incomplete in that they do not include the full set of parameters and energy ranges known to cause satellite operating anomalies. The proton and electron fluxes and Kp are "global" parameters that are applicable to a first order approximation over large areas. H parallel is subject to more localized phenomena and the

measurements generally are applicable to within a few degrees of longitude of the measuring satellite.

Weekly GOES Satellite X-ray and Proton Plots

X-ray plot contains five-minute averaged x-ray flux (watts/ m^2) as measured by GOES 10 (W060) and GOES 11 (W135) in two wavelength bands, .05 - .4 and .1 - .8 nm. The letters A, B, C, M and X refer to x-ray event levels for the .1 - .8 nm band.

Proton plot contains the five-minute averaged integral proton flux (protons/cm 2 –sec-sr) as measured by GOES-11 (W135) for each of the energy thresholds: >1, >10, >30 and >100 MeV. P10 event threshold is 10 pfu (protons/cm 2 -sec-sr) at greater than 10 MeV.

Quiet (Ap≤7) Geomagnetic Conditions
