Space Weather Highlights 14 – 20 April 2008

SEC PRF 1703 22 April 2008

Solar activity was very low. New-cycle polarity sunspot Region 990 (N27, L = 000, class/area Bxo/010 on 15 April) was numbered on 15 April. It produced a single low-level B-class flare on 16 April as it decayed to a spotless plage region.

No proton events were observed at geosynchronous orbit.

The greater than 2 MeV electron flux at geosynchronous orbit reached high levels during 14 - 16 April.

Geomagnetic field activity was at mostly quiet levels during 14 - 15 April. Activity increased to active levels on 16 April with a brief minor storm period detected at high latitudes. Activity decreased to quiet to unsettled levels during 17 - 18 April. Mostly quiet conditions occurred during the rest of the period. ACE solar wind measurements indicated the onset of a co-rotating interaction region (CIR) on 15 April, in advance of a recurrent coronal hole high-speed stream (HSS). Interplanetary magnetic field changes during the CIR included increased Bt (peak 14 nT at 16/1424 UTC) and increased Bz variability (minimum -9 nT at 16/1124 UTC). The high-speed stream commenced on 16 April. ACE detected a peak velocity of 610 km/sec at 16/2204 UTC. Velocities decreased during 17 April, but remained elevated during the rest of the period (range: 465 - 584 km/sec).

Space Weather Outlook 23 April – 19 May 2008

Solar activity is expected to be very low.

No proton events are expected at geosynchronous orbit.

The greater than 2 MeV electron flux at geosynchronous orbit is expected to reach high levels during 25 April - 13 May.

Geomagnetic field activity is expected to be at active levels during 23 - 24 April due to a recurrent coronal hole high-speed stream. Activity is expected to decrease to unsettled levels during 25 April as the high-speed stream subsides. Quiet conditions are forecast during 24 - 30 April. Activity is expected to increase to unsettled to active levels during 01 - 05 May with minor storm levels likely on 02 May as another recurrent coronal hole high-speed stream affects the field. Activity is expected to decrease to quiet to unsettled levels during 06 - 07 May as the high-speed stream subsides. Mostly quiet conditions are expected during 08 - 18 May. Activity is expected to increase to unsettled levels on 19 May.

NOTE: All smoothed values after September 2002 and monthly values after March 2003 are preliminary estimates. The lowest smoothed sunspot index number for Cycle 22, RI = 8.0, occurred in May 1996. The highest smoothed sunspot number for Cycle 23, RI= 120.8, occurred April 2000. *After June 1991, the 10.7 cm radio flux data source is Penticton, B.C. Canada. Prior to that, it was Ottawa.

Weekly Geosynchronous Satellite Environment Summary Week Beginning 13 April 2008

Protons plot contains the five-minute averaged integral proton flux (protons/cm²-sec -sr) as measured by GOES-11 (W135) for each of three energy thresholds: greater than 10, 50, and 100 MeV.

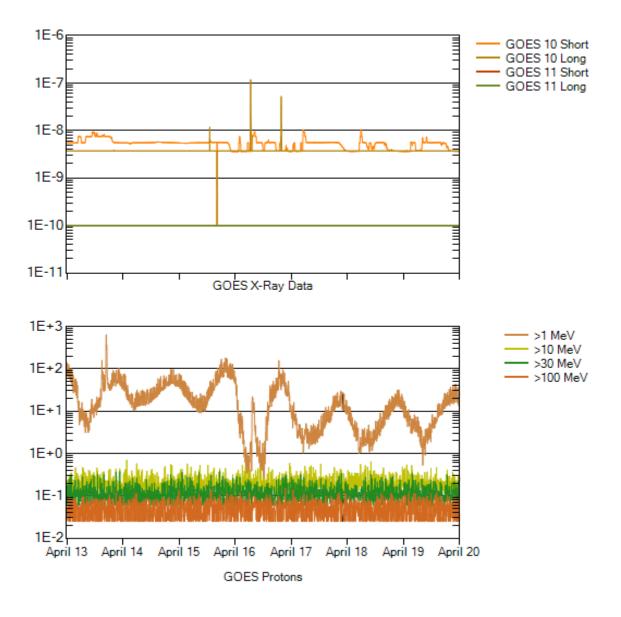

Electrons plot contains the five-minute averaged integral electron flux (electrons/cm²-sec -sr) with energies greater than 2 MeV at GOES-12 (W075).

Hp plot contains the five minute averaged magnetic field H - component in nanoteslas (nT) as measured by GOES-12. The H component is parallel to the spin axis of the satellite, which is nearly parallel to the Earth's rotation axis.

Kp plot contains the estimated planetary 3-hour K-index (derived by the Air Force Weather Agency) in real time from magnetometers at Meanook, Canada; Sitka, AK; Glenlea, Canada; St. Johns, Canada; Ottawa, Canada; Newport, WA; Fredericksburg, VA; Boulder, CO; Fresno, CA and Hartland, UK. These data are made available through cooperation from the Geological Survey of Canada (GSC), British Geological Survey (BGS) and the US Geological Survey. These may differ from the final Kp values derived from a more extensive network of magnetometers.

The data included here are those now available in real time at the SEC and are incomplete in that they do not include the full set of parameters and energy ranges known to cause satellite operating anomalies. The proton and electron fluxes and Kp are "global" parameters that are applicable to a first order approximation over large areas. H parallel is subject to more localized phenomena and the measurements generally are applicable to within a few degrees of longitude of the measuring satellite.

Weekly GOES Satellite X-ray and Proton Plots

X-ray plot contains five-minute averaged x-ray flux (watts/ m^2) as measured by GOES 10 (W060) and GOES 11 (W135) in two wavelength bands, .05 - . 4 and .1 - .8 nm. The letters A, B, C, M and X refer to x-ray event levels for the .1 - .8 nm band.

Proton plot contains the five-minute averaged integral proton flux (protons/cm² –sec-sr) as measured by GOES-11 (W135) for each of the energy thresholds: >1, >10, >30 and >100 MeV. P10 event threshold is 10 pfu (protons/cm²-sec-sr) at greater than 10 MeV.
